CS 4100 Computer Architecture
Midterm Exam
10:10 a.m. ~ 12:20 p.m.
April 23, 2019

1. (6 points) Explain the following terms:
   (a) Yield
   (b) Amdahl's law
   (c) Stored-program concept

2. (8 points) Answer TRUE or FALSE.
   (a) There is at least one RISC-V instruction that can directly store a result of an ALU calculation into memory.
   (b) If we have only one or two parameters to send to a non-recursive C function, then in the corresponding RISC-V code, we can use registers and do not need to use the stack for the parameter(s).
   (c) Overflow will never occur if two 2's complement numbers of different signs are added.
   (d) In the IEEE 754 single precision format, any floating-point number whose exponent bits are all 0 represents the decimal number 1.

3. (6 points) There are three instruction-set-architecture design principles: 1. Simplicity favors regularity, 2. Smaller is faster, 3. Good design demands good comprises. Please give one RISC-V example for each of the principle.

4. (15 points) Consider an instruction set whose instructions are divided into four classes: A, B, C, and D. Suppose P1 and P2 are two different processors implementing this instruction set. P1 has a clock rate of 2GHz and CPIs of 1, 1, 2, and 4 for instructions respectively in classes A, B, C, and D. P2 has a clock rate of 3GHz and CPIs of 2, 3, 3, and 4 for instructions respectively in classes A, B, C, and D. There is a program with an instruction count of 1.0E6 and its instruction mix is as follows: 40% class A, 20% class B, 20% class C, and 20% class D.
   (a) (4 points) What is the average CPI of this program on each processor?
   (b) (4 points) What is the number of clock cycles of this program on each processor?
   (c) (3 points) Which processor is faster when running this program? Why?
   (d) (4 points) Suppose if this program is now run on processor P1 you want this program to run 1.5 times faster by reducing the CPI for instruction in class D.

What should the new CPI be for instructions in class D?

5. (10 points) Consider the conversion between RISC-V machine instructions and assembly instructions.

   (a) (5 points) Give the instruction type and assembly instruction for the following RISC-V machine instruction:

   0000 0000 0111 1110 1011 1000 0010 0011

   (b) (5 points) Give the instruction type and hexadecimal representation of the following RISC-V assembly instruction, where 0x2000 denotes the hexadecimal number 2000_{hex}:

   beq x10, x11, 0x2000

6. (10 points) Assume that registers x29 and x30 hold the values $A7496AC74FE04DD1_{hex}$ and $E20190422948769_{hex}$, respectively.

   (a) (4 points) What is the hexadecimal value of register x28 after the following instructions execute?

   ```
   srai    x29, x29, 8
   or      x28, x30, x29
   ```

   (b) (6 points) What is the hexadecimal value of register x28 after the following instructions execute? Does the value in x28 have the desired result, or has there been overflow? Why?

   ```
   slli    x28, x29, 16
   add     x28, x28, x30
   ```

7. (10 points) Translate the following C code to RISC-V assembly code. Assume that the values of m, n, i, and j are in registers x3, x4, x11, and x12, respectively. Also, assume that each element of array D is a 4-byte integer and register x14 holds the base address of D.

   ```
   for (i=0; i<m; i++)
       for (j=0; j<n; j++)
           D[i] = D[i] + 4*i*j;
   ```

8. (15 points) Consider the IEEE 754 floating-point standard and its arithmetic operations.

   (a) (6 points) Represent the decimal numbers 4.5 and -6.25 in the IEEE 754 single precision format.

   (b) (4 points) Calculate 4.5 + (-6.25). The result should be written in the IEEE 754 single precision format.

(c) (5 points) Calculate 4.5 * (-6.25). The result should be written in the IEEE 754 single precision format.

9. (15 points) This problem is about arithmetic and logical circuits.

(a) (5 points) In class we have described a 64-bit ALU whose block diagram is shown below (Fig. 9-1).

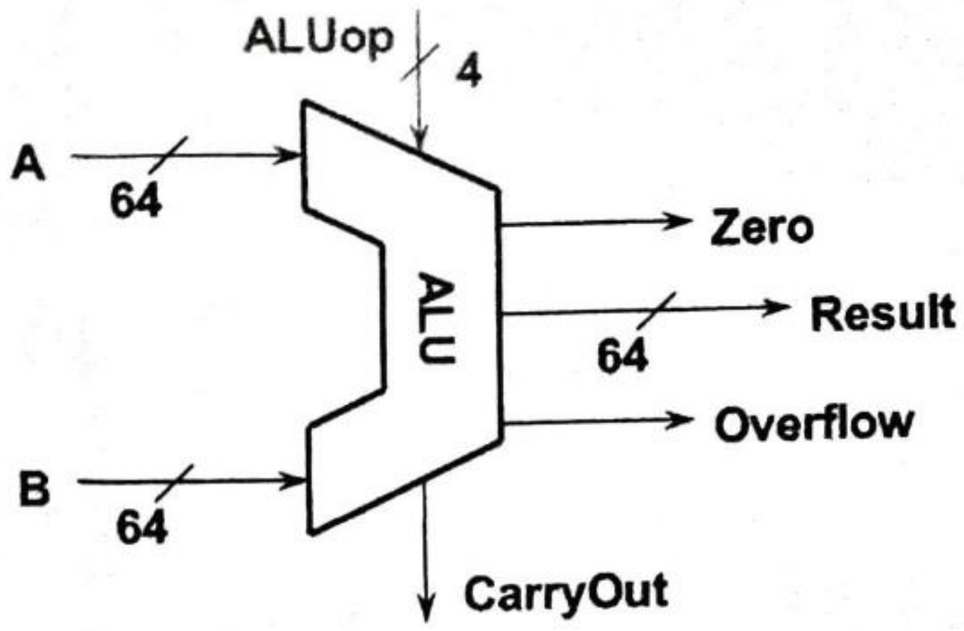

Fig. 9-1

If we ignore the slt (set-less-than) operation and change the function specification of the ALU as follows, what will the new ALU look like for bit 0?

Operation	ALUop
add	1111
sub	1011
and	1110
or	1101
nor	0010

Hint: You can modify the 1-bit ALU introduced in class (Fig. 9-2) to derive your circuit.

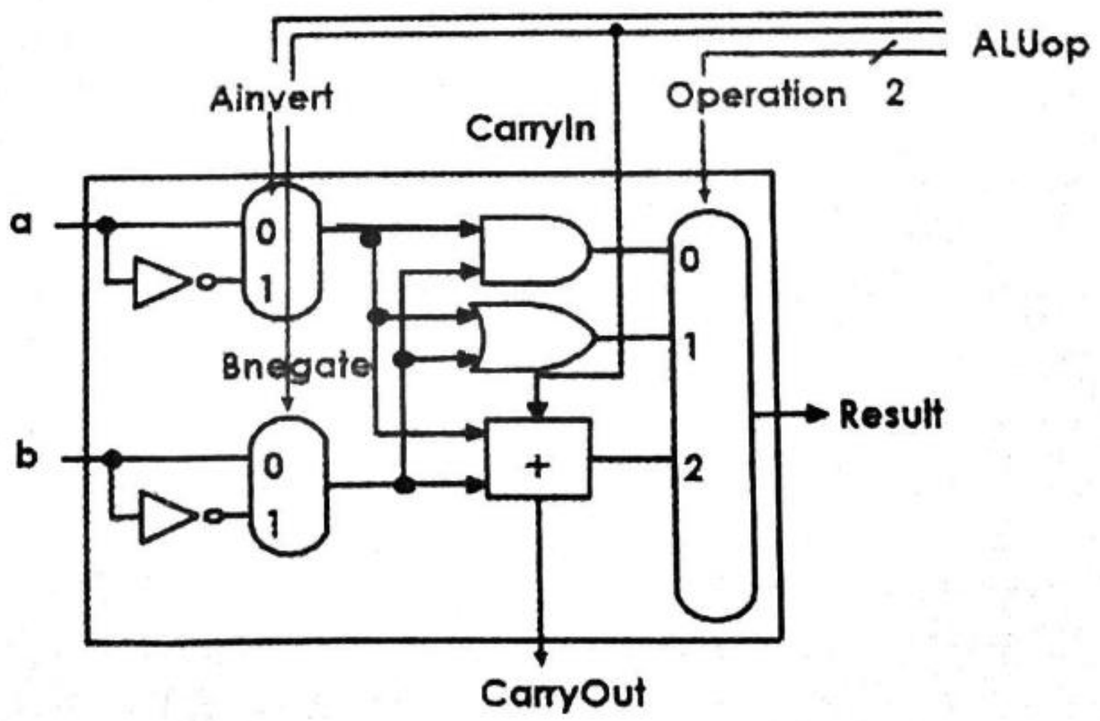

Fig. 9-2

(b) (10 points) The multiply hardware (Fig. 9-3) and algorithm (Fig. 9-4) have been introduced in class for performing 64-bit multiplication on unsigned integers. Now consider a 4-bit version of this hardware, and use it to calculate 0010 * 0101. You must show all steps which are executed in each iteration.

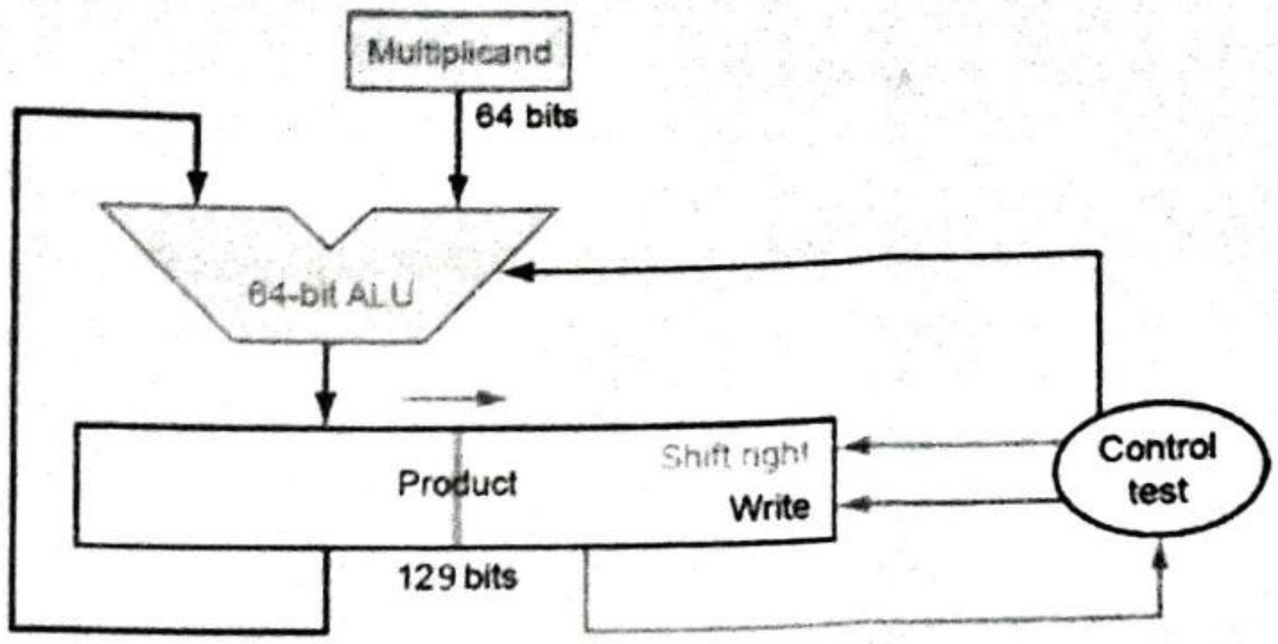

Fig. 9-3

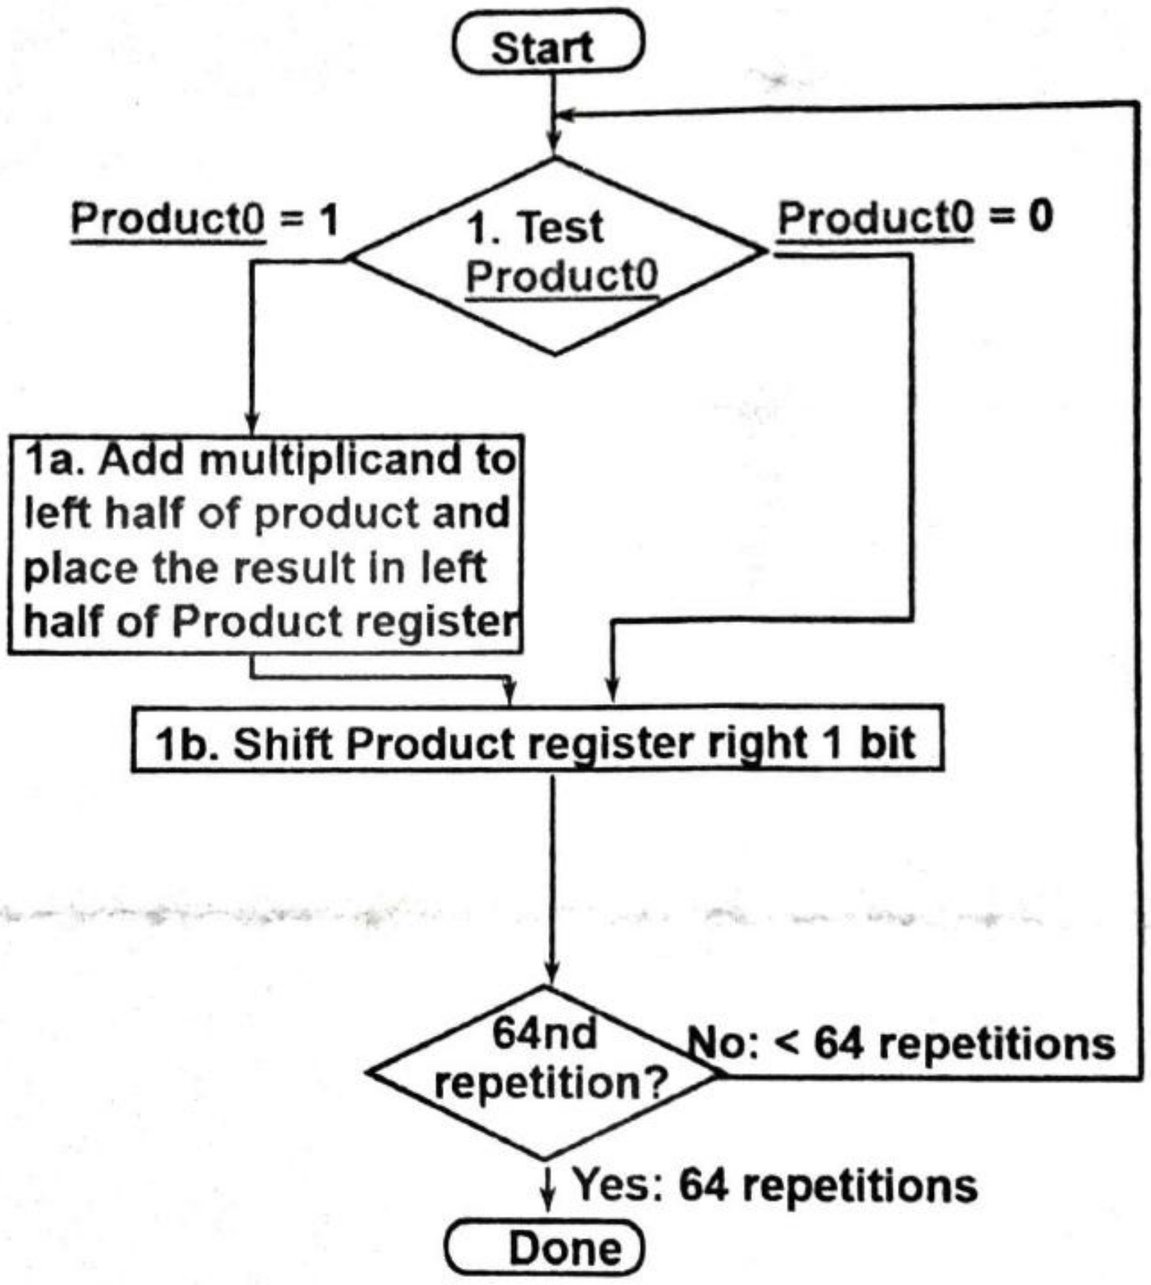

Fig. 9-4

10. (5 points) In class we have described a 16-bit two-level carry lookahead adder shown below (Fig. 10-1). Given two 16-bit binary numbers A[15:0] = 0001 1010 0011 0011 and B[15:0] =1110 0101 1110 1011, show how this adder produces the value of C8.

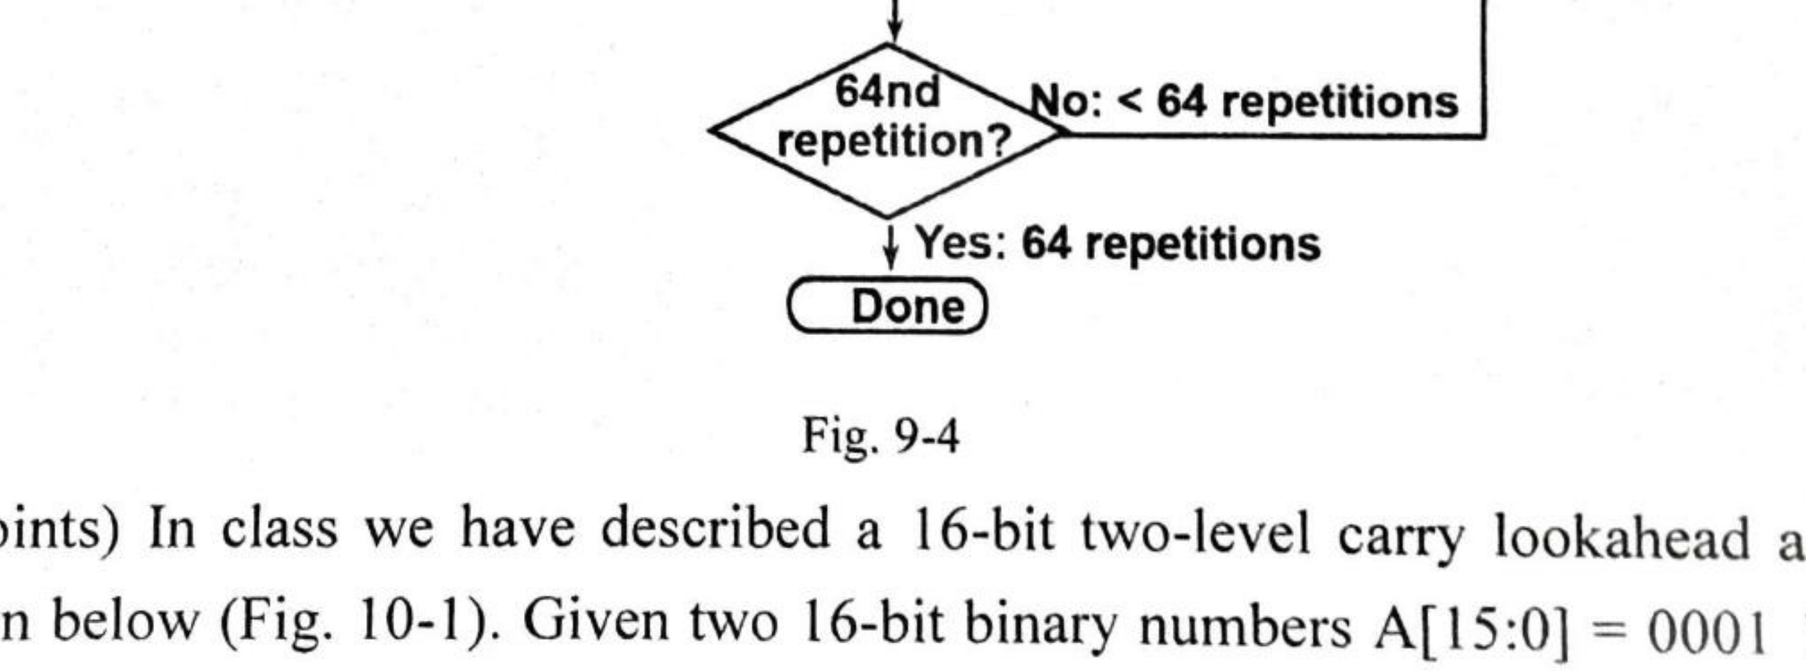

Fig. 10-1

xor	R	XOR	R[rd] = R[rs1] ^ R[rs2]	
xori	I	XOR Immediate	R[rd] = R[rs1] ^ imm	

Notes: 1) The Word version only operates on the rightmost 32 bits of a 64-bit registers
2) Operation assumes unsigned integers (instead of 2's complement)
3) The least significant bit of the branch address in jalr is set to 0
4) (signed) Load instructions extend the sign bit of data to fill the 64-bit register
5) Replicates the sign bit to fill in the leftmost bits of the result during right shift
6) Multiply with one operand signed and one unsigned
7) The Single version does a single-precision operation using the rightmost 32 bits of a 64-bit F register
8) Classify writes a 10-bit mask to show which properties are true (e.g., -inf, -0, +0, +inf, denorm, ...)
9) Atomic memory operation; nothing else can interpose itself between the read and the write of the memory location
The Immediate field is sign-extended in RISC-V

REGISTER NAME, USE, CALLING CONVENTION

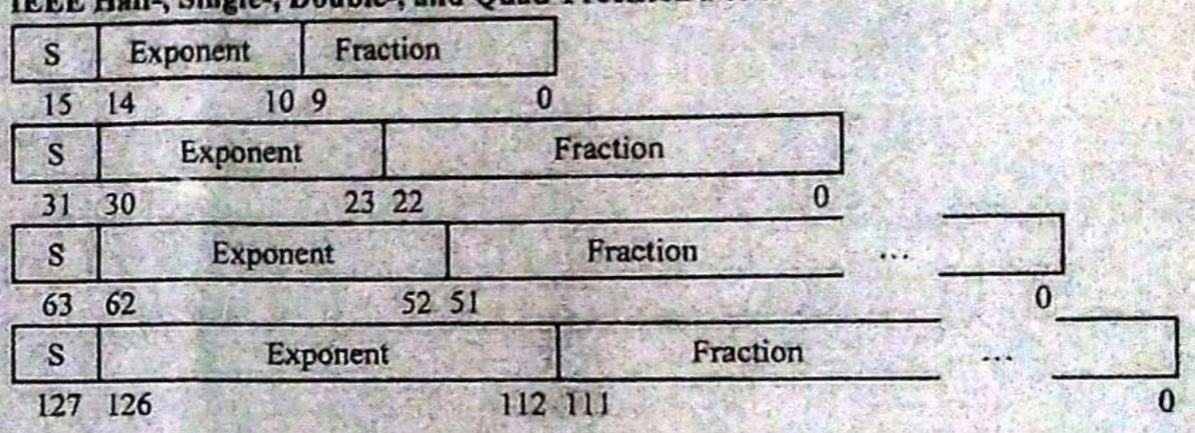
REGISTER	NAME	USE	SAVER
x0	zero	The constant value 0	N.A.
x1	ra	Return address	Caller
x2	sp	Stack pointer	Callee
x3	gp	Global pointer	--
x4	tp	Thread pointer	--
x5-x7	t0-t2	Temporaries	Caller
x8	s0/fp	Saved register/Frame pointer	Callee
x9	s1	Saved register	Callee
x10-x11	a0-a1	Function arguments/Return values	Caller
x12-x17	a2-a7	Function arguments	Caller
x18-x27	s2-s11	Saved registers	Callee
x28-x31	t3-t6	Temporaries	Caller
f0-f7	ft0-ft7	FP Temporaries	Caller
f8-f9	fs0-fs1	FP Saved registers	Callee
f10-f11	fa0-fa1	FP Function arguments/Return values	Caller
f12-f17	fa2-fa7	FP Function arguments	Caller
f18-f27	fs2-fs11	FP Saved registers	Callee
f28-f31	ft8-ft11	R[rd] = R[rs1] + R[rs2]	Caller

IEEE 754 FLOATING-POINT STANDARD

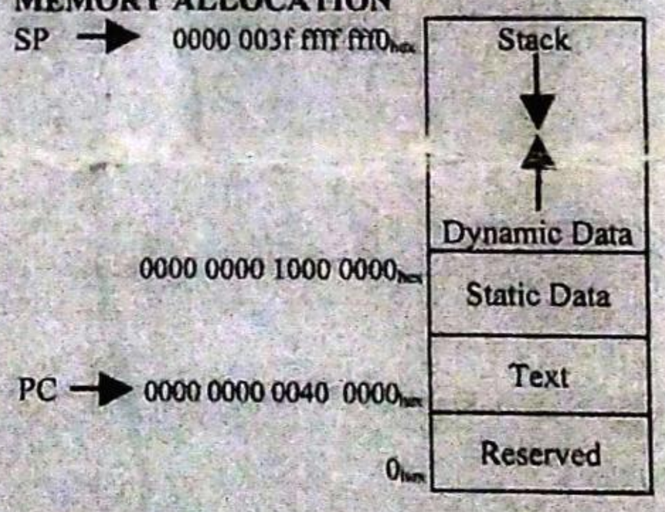
$(-1)^S \times (1 + \text{Fraction}) \times 2^{(\text{Exponent} - \text{Bias})}$

where Half-Precision Bias = 15, Single-Precision Bias = 127,
Double-Precision Bias = 1023, Quad-Precision Bias = 16383

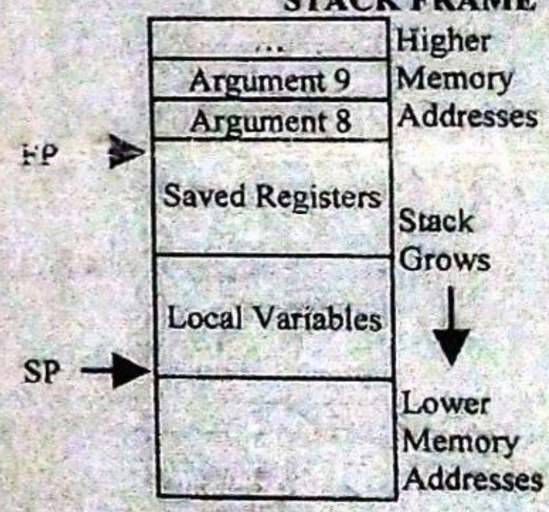
IEEE Half-, Single-, Double-, and Quad-Precision Formats:



MEMORY ALLOCATION



STACK FRAME



SIZE PREFIXES AND SYMBOLS

SIZE	PREFIX	SYMBOL	SIZE	PREFIX	SYMBOL
10^3	Kilo-	K	2^{10}	Kibi-	Ki
10^6	Mega-	M	2^{20}	Mebi-	Mi
10^9	Giga-	G	2^{30}	Gibi-	Gi
10^{12}	Tera-	T	2^{40}	Tebi-	Ti
10^{15}	Peta-	P	2^{50}	Pebi-	Pi
10^{18}	Exa-	E	2^{60}	Exbi-	Ei
10^{21}	Zetta-	Z	2^{70}	Zebi-	Zi
10^{24}	Yotta-	Y	2^{80}	Yobi-	Yi
10^{-3}	milli-	m	10^{-15}	femto-	f
10^{-6}	micro-	μ	10^{-18}	atto-	a
10^{-9}	nano-	n	10^{-21}	zepto-	z
10^{-12}	pico-	p	10^{-24}	yocto-	y
